Relational Database Management System (RDMS)
e.g. sqlite, MySQL, PostgreSQL, Oracle

Structured Query Language (SQL)
SQL operation is either a statement (write) or query (read)

Architecture
Database
Schema aka namespace
Table
Schema: https://www.postgresql.org/docs/current/ddl-schemas.htm
[SQL 2023] 4.28 Schemas
A **database** is a collection of **schemas**.
A **schema aka namespace** is a collection of **tables**.
Each table is **qualified** by the database and schema
e.g.

mydb.public.mytable	**database** = mydb **schema**=public **table**=mytable
mytable	

Information schema

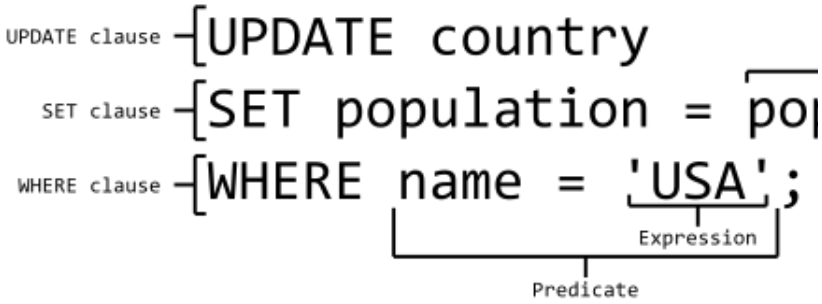
Syntax
Syntax
Wiki: https://en.wikipedia.org/wiki/SQL_syntax

Query
Statement
In general, **query** is **read**, **statement** is **write**
e.g.

SELECT ...	query
UPDATE ...	statement

Clause
A **clause** is a table operation using one of the **keywords**
Both queries and statements are made of clauses.
Both queries and statements themselves are clauses.
e.g.

SELECT ...	SELECT clause
WHERE x = 1	WHERE clause
FROM ...	FROM clause

Keywords
Identifier
Predicate
Expression
A clause is made of a **keyword** + other **clauses**, **expressions, predicates**
e.g.


SELECT	keyword
mydb	identifier (db name)
mytable	identifier (table name)
x + 1	expression
x = 1	predicate i.e. boolean
x IS NULL	predicate
